KA F D 200 - 4 Stb.

transformatorisch drehzahlregelbar / speed-controllable by transformer
Stb.
Polzahl des Antriebsmotors / Number of poles
-2; -4
Nennweite / Impeller diameter
200 ... 450
Motorversion / Motor type
E = 1 x 230V/50 Hz
D = 3 x 400V/50 Hz
Laufradtyp / Impeller type
T; F
Abluftbox / Air-extract Box

Eigenschaften und Ausführung

Die Wolter-Abluftbox eignet sich insbesondere zur Förderung stark verschmutzter Luft, wie sie zum Beispiel in Großküchen entsteht. Eine großzügig angelegte Gehäuseschalldämmung durch kunststoffbeschichtete Mineralfasermatten gewährleistet eine minimale Geräuschenwicklung. Der Antrieb erfolgt durch wartungsfreie, außenliegende Norm-Flanschmotoren in Einphasen- oder Drehstromausführung. Laufrad und Motor sind fest in der ausschwenkbaren Seitenwand montiert. Das abnehmbare Laufrad ermöglicht eine einfache Reinigung der im Luftstrom liegenden Teile.

Die zulässige Fördermitteltemperatur liegt zwischen -30°C und +120°C.

Antrieb

Der Antrieb erfolgt mit Normmotoren in Flanschausführung, Schutzart IP54 oder IP55, Isolationsklasse B. Bis Motorbaugröße 100 können spannungsregelbare Motoren verwendet werden.

Laufräder

WOLTER - Abluftboxen können sowohl mit Trommellaufrafd als auch mit rückwärtsgekrümmten Hochleistungslaufrädern geliefert werden. Die Trommellaufräder bestehen aus sendzimirverzinktem Stahlblech, rückwärts gekrümmte Laufräder aus Aluminium. Beide Bauarten zeichnen sich durch hohe Wirkungsgrade bei minimaler Geräuschenwicklung aus.

- › KAT. - vorwärtsgekrümmte Schaufeln mit Spiralgehäuse
- › KAF. - rückwärtsgekrümmte Schaufeln ohne Spiralgehäuse

Gehäuse

Das Gehäuse der WOLTER - Abluftbox besteht aus einem verwindungssteifen Aluminiumrahmen mit stabilen Kunststoff-Eckverbündern. Die Beplankung erfolgt mit verzinkten Blechen mit innenliegender Schalldämmung aus Mineralfasermatten. Die strömungstechnisch optimierte Ventilatorspirale aus verzinktem Stahlblech gewährleistet beste Wirkungsgrade und somit einen wirtschaftlichen Betrieb der Abluftbox. Die runden saug- und druckseitigen Anschlußstutzen entsprechen den genormten Kanaldurchmessern und erlauben den problemlosen Anschluß von Wickelfalz- oder Aluflexrohren mit entsprechenden Schnellverbindern. Zur schnellen und einfachen Reinigung lässt sich das Laufrad komplett ausschwingen und abnehmen.

Drehzahlregelung

Alle Geräte sind mittels Frequenzumformer regelbar. Die mit „Stb.“ gekennzeichneten Motoren sind zusätzlich auch transformatorisch drehzahlregelbar.

Luftleistungskennlinien

Die Kennlinien für diese Typenreihe wurden in Einbauart B (frei ansaugend, druckseitig angeschlossen) aufgenommen und zeigen die statische Druckerhöhung Δp_{st} als Funktion des Volumenstroms. Der dynamische Druck p_{d2} ist auf den Flanschquerschnitt am Ventilatoraustritt bezogen.

Geräusche

Die Ermittlung der Schallleistungspegel erfolgt nach dem Hüllflächenverfahren nach DIN 45 635, Teil 38. In den Kennlinien ist der A-bewertete GehäuseSchallleistungspegel L_{WA2} nach DIN 45 635, Teil 38, angegeben.

Der A-bewertete Freiausblas-Schallleistungspegel L_{WA6} nach DIN 45 635, Teil 38 wird näherungsweise wie folgt ermittelt:

$$L_{WA6} = L_{WA2} + 20 \text{ dB(A)}$$

Der A-bewertete Freiansaug-Schallleistungspegel L_{WA5} nach DIN 45 635, Teil 38 wird näherungsweise wie folgt ermittelt:

$$L_{WA5} = L_{WA6} - 3 \text{ dB(A)}$$

Der für die Auslegung von Schalldämpfern maßgebende Schallleistungspegel in den einzelnen Oktavbereichen kann aus folgender Formel ermittelt werden:

$$L_{WAOKt} = L_{WA} + L_{Warel}$$

Die relativen Oktav-Schallleistungspegel L_{Warel} bei den Oktav-Mittelfrequenzen sind den Tabellen zu entnehmen. Sie sind bei 0,5 x Vmax ermittelt worden. Den A-bewerteten Schalldruckpegel L_{PA} in 1m Abstand erhält man annähernd, indem man vom A-Schallleistungspegel L_{WA} 7 dB (A) abzieht.

Zu beachten ist, dass Reflexionen und Raumcharakteristik sowie Eigenfrequenzen die Größe des Schalldruckpegels unterschiedlich beeinflussen.

Zubehör

Passend zu den Ventilatoren sind erhältlich:

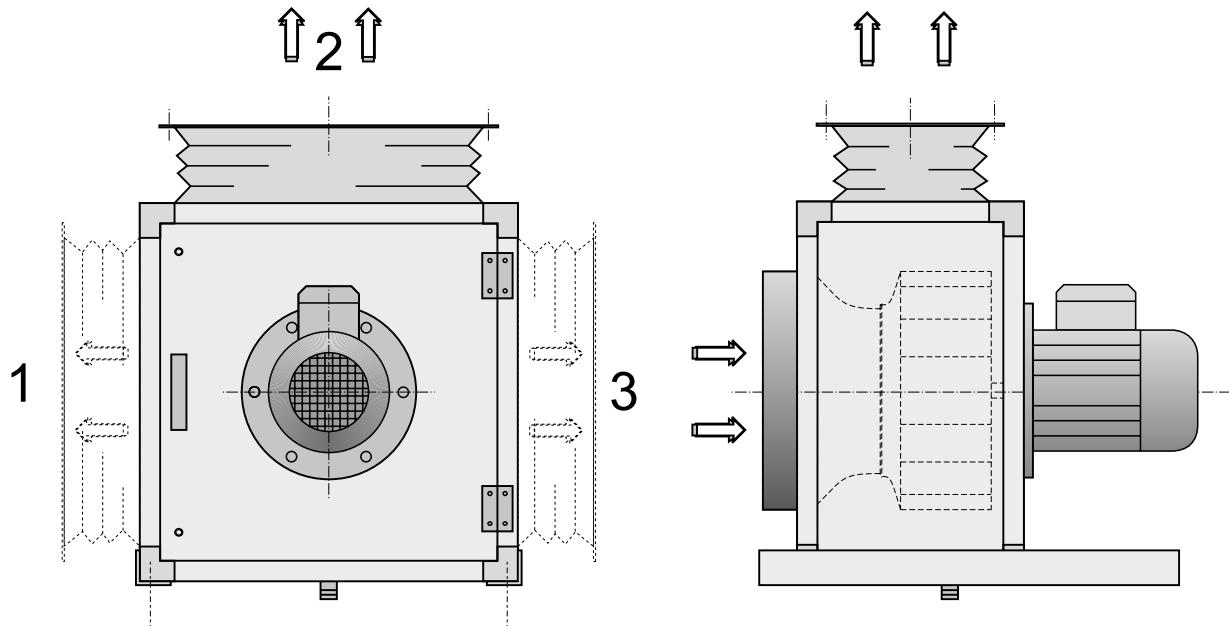

- › Elastische Stutzen für Druck- und Saugseite
- › Rohrschnellverbinder für runde Kanäle ohne Anschlußflansch
- › Regelgeräte, nähere Beschreibungen dieser Regler finden Sie in Kapitel 7 ab Seite 332.

KAF. / KAT.

KAF.

Der Ausblas kann auf alle Seiten montiert werden, dadurch ist die Box äußerst variabel einsetzbar. Bei der Bestellung ist immer die Ausblasrichtung (1, 2 oder 3).

Design features

Wolter air-extract boxes are used to extract more heavily polluted air, for example from professional kitchens. A well-insulated housing keeps the noise level to a minimum. The impeller is driven by a standard flange-type motor, single or 3-phase supply, mounted outside of the airstream. Motors suitable for speed control are available. Impeller and motor are mounted on a swivel door. The impeller is easily dismounted for cleaning.

The permissible temperature range of the conveyed medium is -30°C to +120°C.

Motors

All fans are equipped with standard flange type IEC-motors. Protection class IP54, isolation class B. Up to motor size 100, voltage-controllable motors can be supplied.

Impeller

Wolter air-extract boxes are fitted with either forward-curved or backward-curved impellers. Forward-curved impellers are manufactured of galvanised sheet metal, backward-inclined impellers are made of aluminium. The design of both impeller types guarantees high efficiency and minimal noise emissions.

- › KAT. - forward-curved impeller with scroll
- › KAF. - backward-curved impeller without scroll

Casing

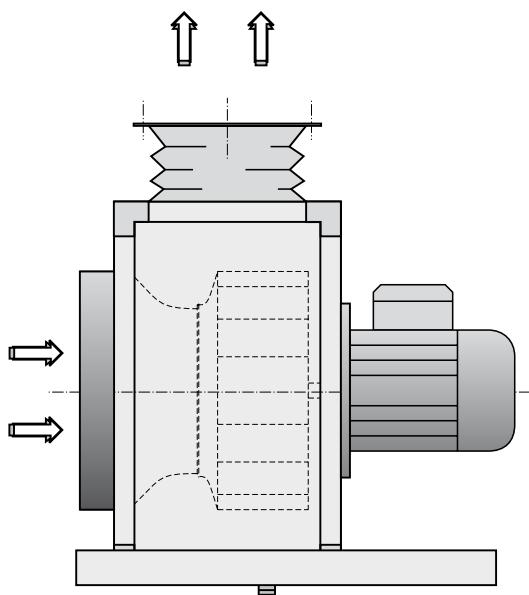

Wolter air-extract boxes have a torsion-resistant aluminium frame, joined by solid plastic corners. All side plates are made of galvanised sheet metal insulated with noise-absorbing mineral wool. The aerodynamically shaped scroll (KAT) guarantees high efficiency. KAF type fans are fitted with a plug fan impeller without scroll. The fan inlet and outlet can easily be connected to standard air ducts. Special connection clamps (RSV) are available.

Speed Control

All KAT./KAF. type fans are speed-controllable by frequency converter. All models marked „Stb.“ are also suitable for speed control by transformer.

KAF.

The air-extract box allows multiple discharge positions. When ordering, please specify the required exhaust orientation (1, 2 or 3).

Fan performance curves

The performance curves for these fan types have been established in mounting position B (installed on the pressure side and open on the suction side) and show the total pressure increase Δp as a function of the volume flow. The dynamic pressure p_{d2} refers to the flange cross-sectional area of the fan outlet.

Sound levels

The ascertaining of the sound level follows the enveloping surface method according to DIN 45 635 section 38. The figures in the air performance curves represent the A-weighted sound power level radiated to the surrounding (L_{WA2}) in decibels.

The A-weighted sound power level at the outlet side L_{WA6} according to DIN 45 635, part 38, is obtained approximately as follows:

$$L_{WA6} = L_{WA2} + 20 \text{ dB(A)}$$

The A-weighted sound power level at the inlet side L_{WA5} according to DIN 45 635, part 38, is obtained approximately as follows:

$$L_{WA5} = L_{WA6} - 3 \text{ dB(A)}$$

The octave sound power level is important for the choice of suitable sound attenuators. It is obtained as follows.

$$L_{WA0kt} = L_{WA} + L_{WArel}$$

The relative octave sound power level L_{WArel} at octave medium frequency can be taken from the tables. These levels have been established at 0.5 x Vmax.

The A-weighted sound pressure level L_{PA} at a distance of 1 metre is obtained approximately by deducting 7 dB(A) from the A-weighted sound power level L_{WA} .

It is important to note that reflexion and environmental characteristics as well as resonant frequencies influence the sound pressure levels in different ways.

Accessories

The following ancillary equipment is available:

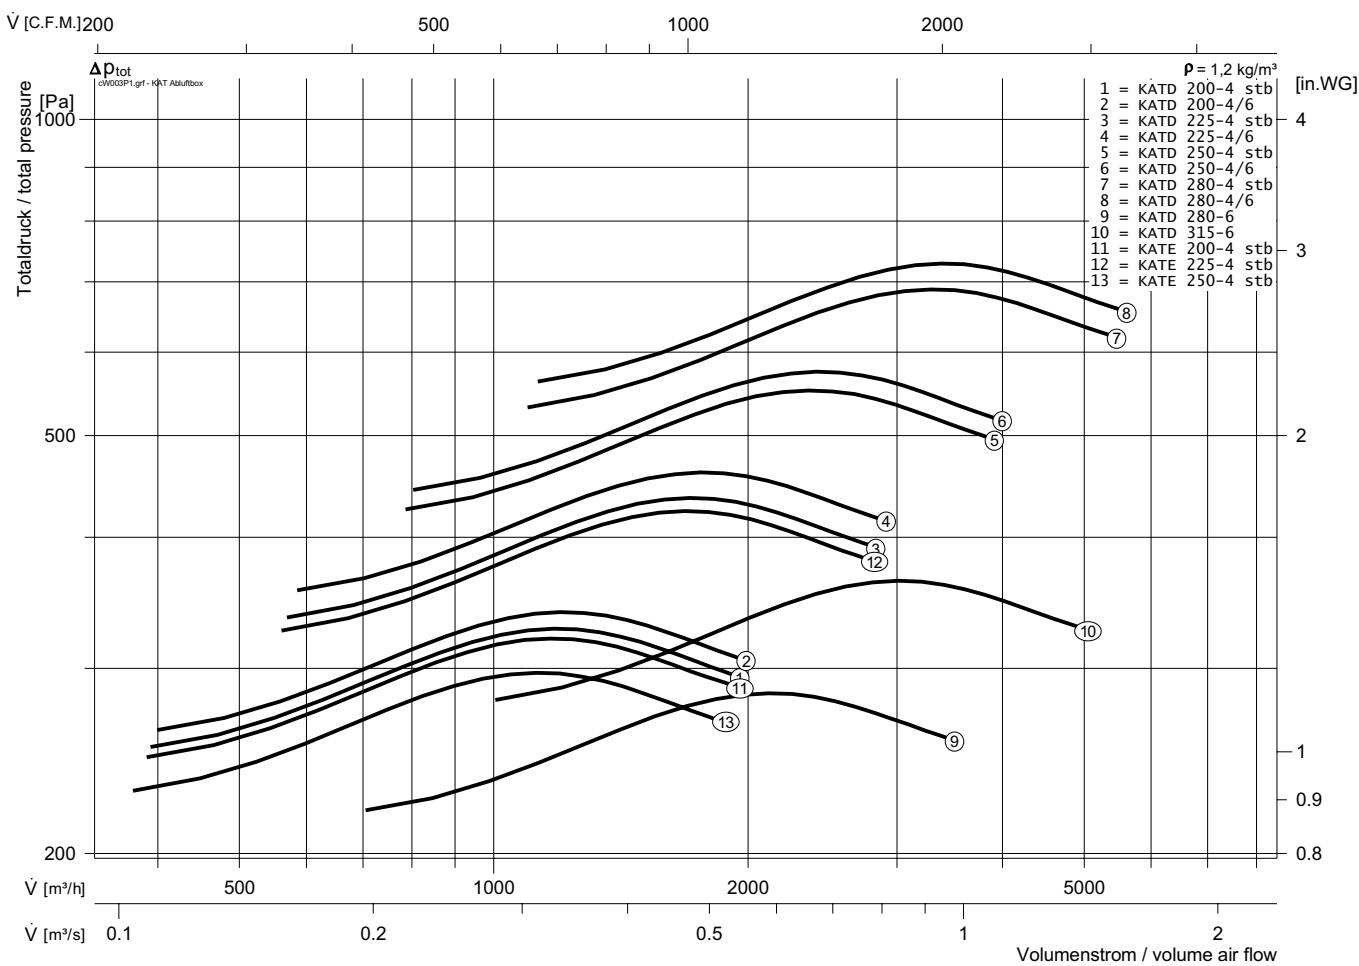

- › inlet and outlet flexible connections
- › RSV clamps to connect tubes without flanges
- › Control units. For a more detailed description of control units, please refer to chapter 7 of this catalogue (page 332ff.)
